Name: Fahim Ul Rehman

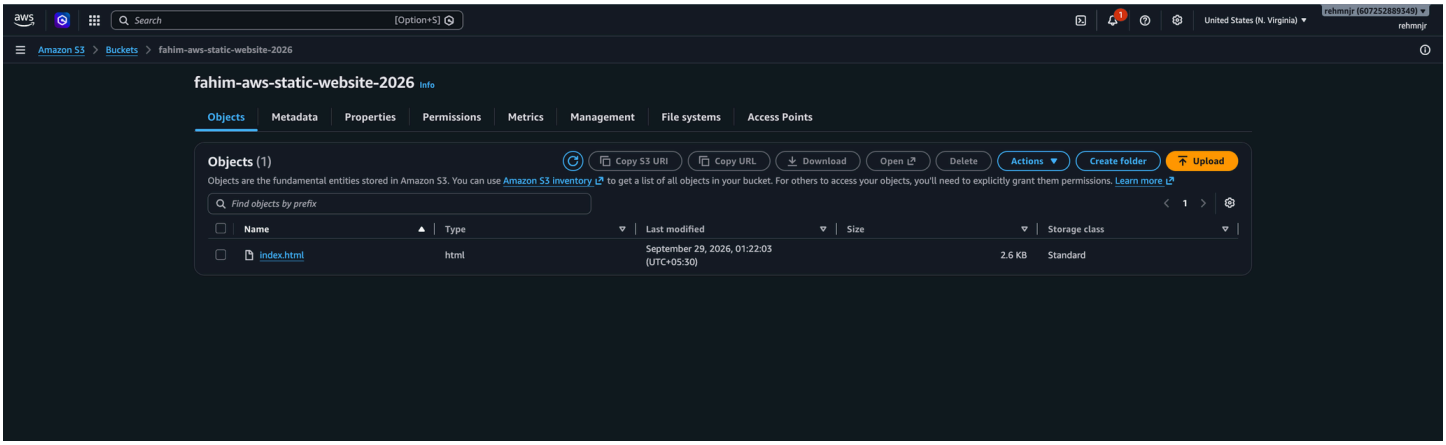

Project 1 – Static Website Hosting on AWS

Build and deploy a static website using Amazon S3, CloudFront, CloudWatch, and SNS.

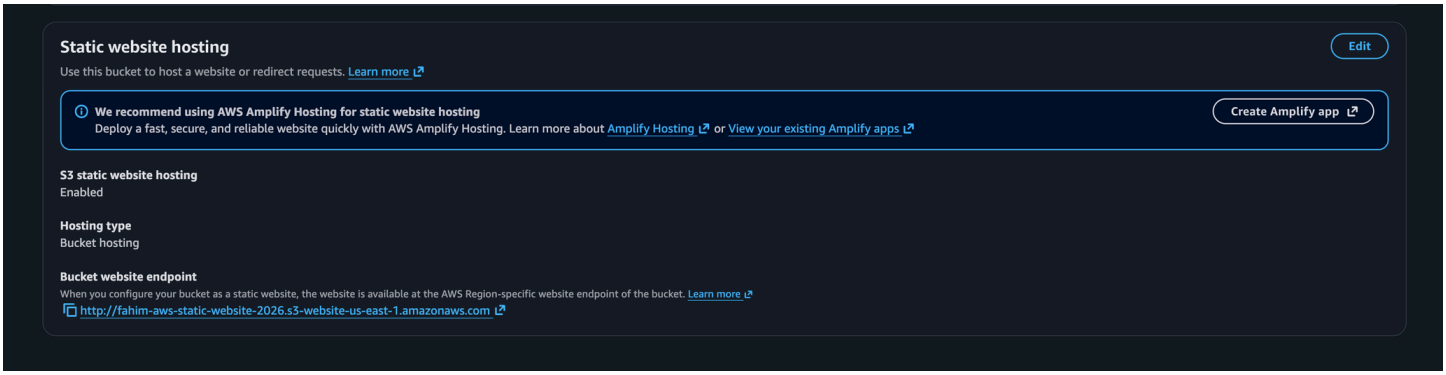

Creating S3 Bucket : [fahim-aws-static-website-2026]

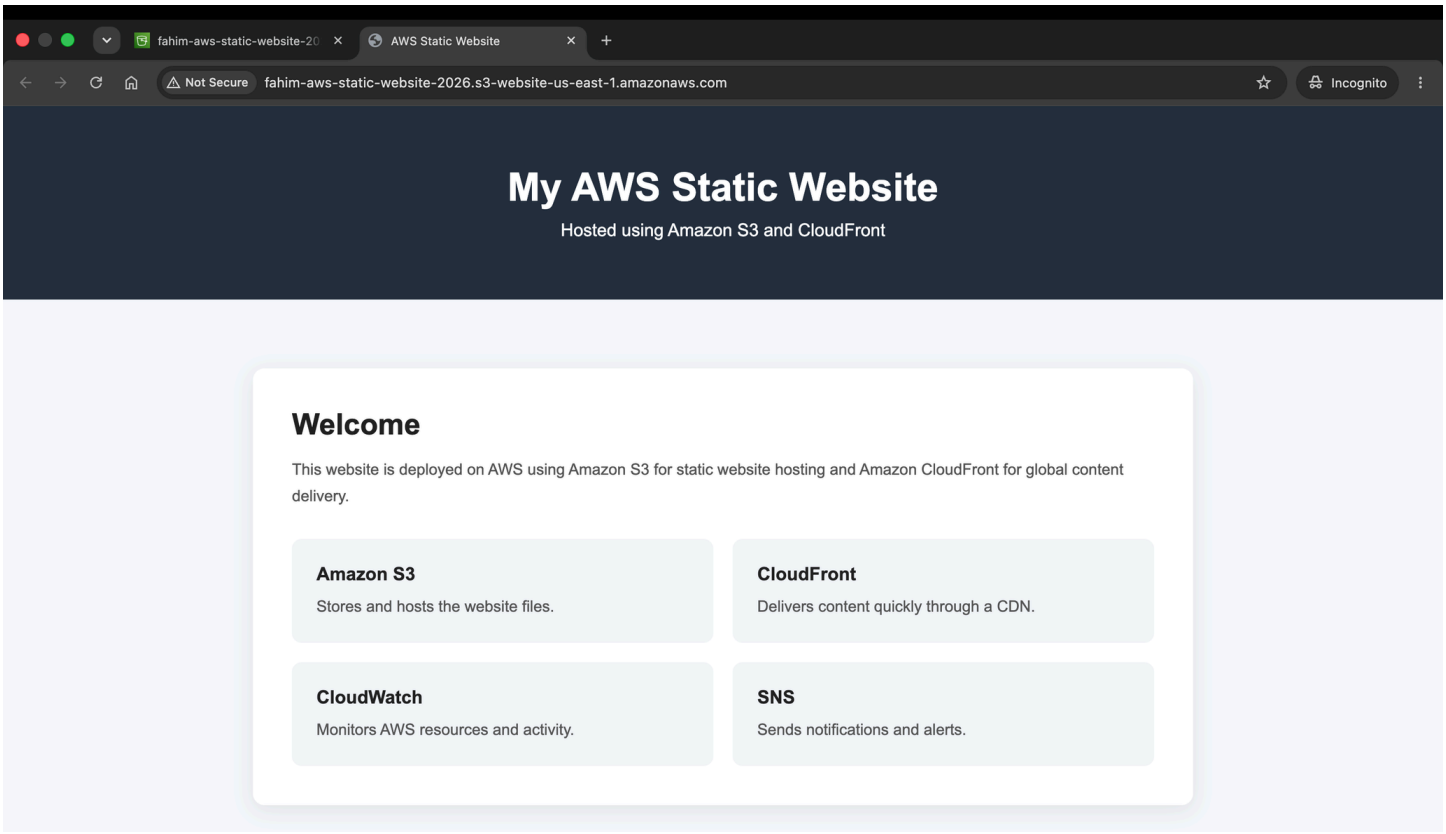

Uploaded the Index.html file into the S3 bucket

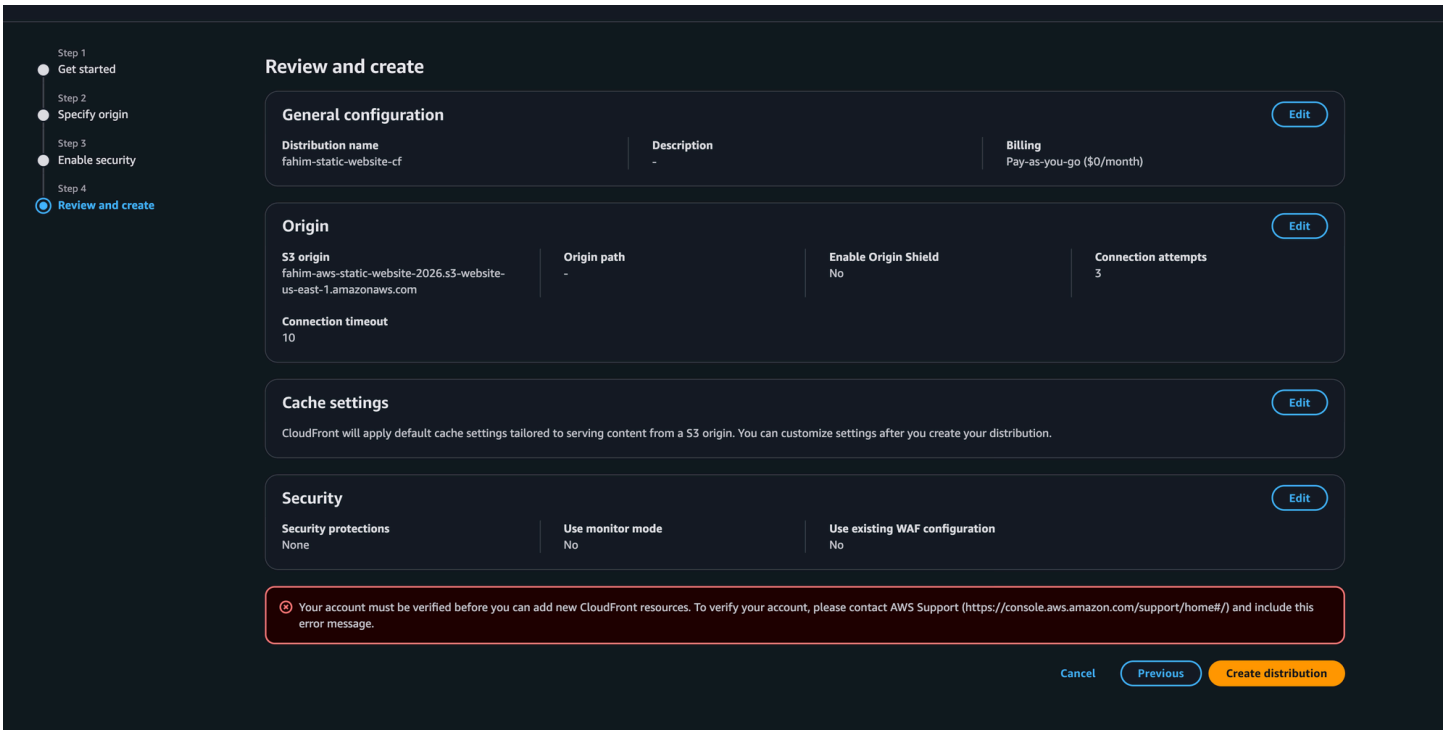

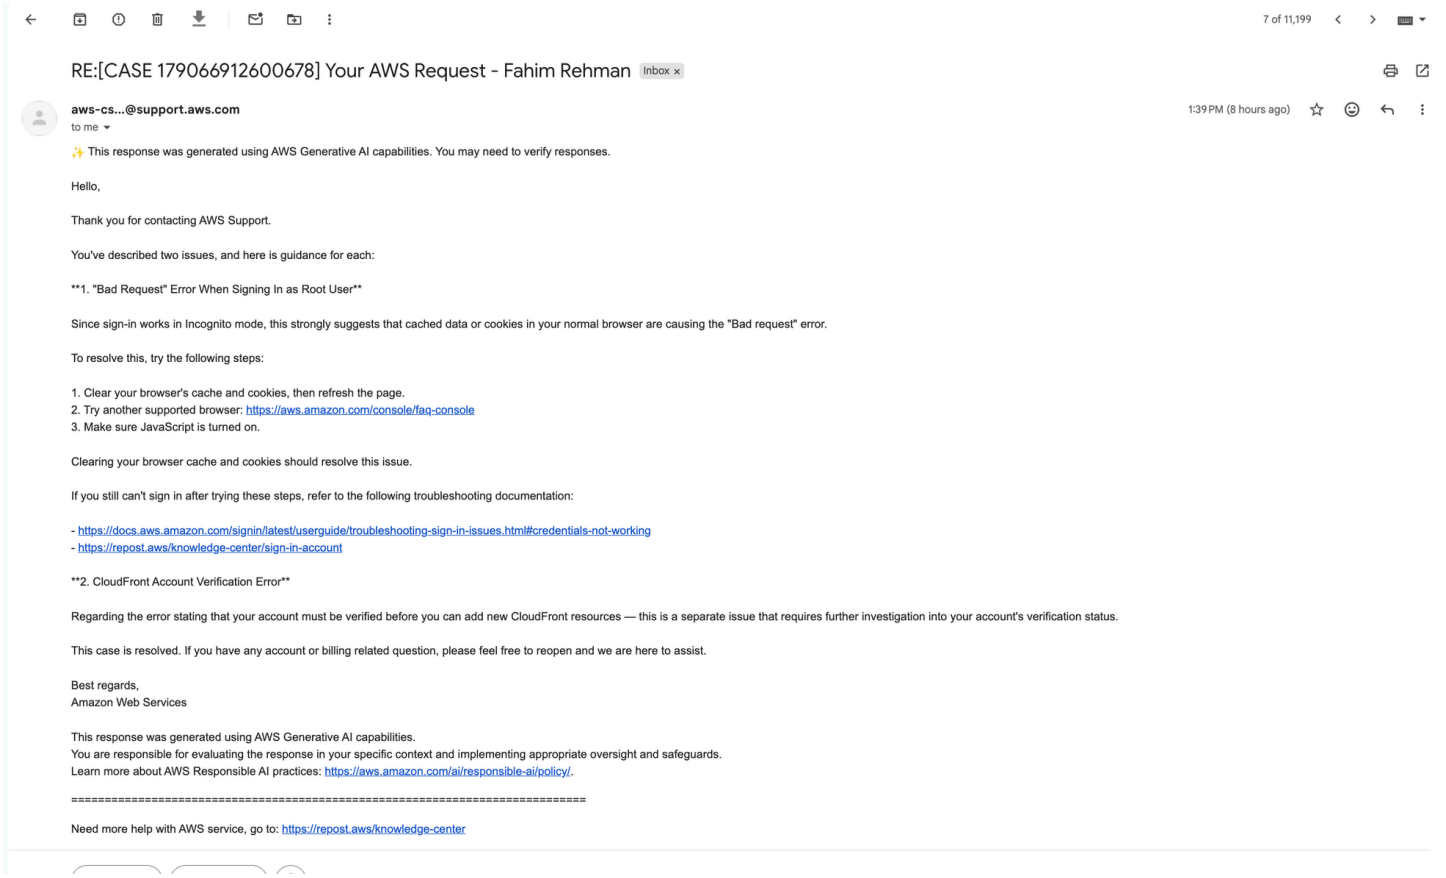

Enabled the S3 static website hosting and added the bucket policy

Try to create a Cloud Front many times but get this error, which is not understandable to me

Hello,

Thank you for contacting AWS Support.

You've described two issues, and here is guidance for each:

1. "Bad Request" Error When Signing In as Root User

Since sign-in works in Incognito mode, this strongly suggests that cached data or cookies in your normal browser are causing the "Bad request" error.

To resolve this, try the following steps:

1. Clear your browser's cache and cookies, then refresh the page.
2. Try another supported browser: https://aws.amazon.com/console/faq-console
3. Make sure JavaScript is turned on.

Clearing your browser cache and cookies should resolve this issue.

If you still can't sign in after trying these steps, refer to the following troubleshooting documentation:

- https://docs.aws.amazon.com/signin/latest/userguide/troubleshooting-sign-in-issues.html#credentials-not-working
- https://repost.aws/knowledge-center/sign-in-account

2. CloudFront Account Verification Error

Regarding the error stating that your account must be verified before you can add new CloudFront resources — this is a separate issue that requires further investigation into your account's verification status.

This case is resolved. If you have any account or billing related question, please feel free to reopen and we are here to assist.

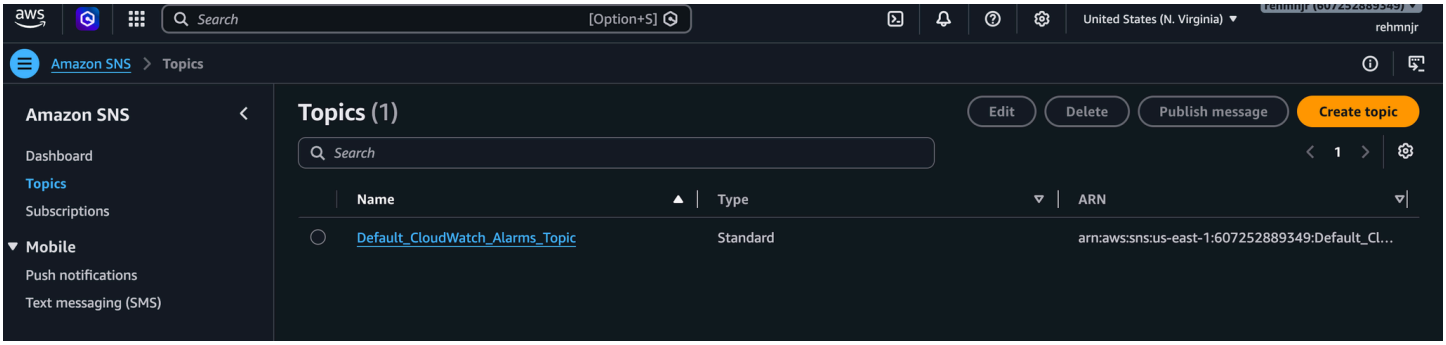

Best regards,
Amazon Web Services
